

Circuit Description

Keyboard circuit:

- a. The function of MCU SE27A is used for processing signal produced by optical key operation and transmitting the signal to RF circuit formed by U3 and other electronic components to modulate, amplify and send out.
- b. The RF signal of 2403-2479MHz is generated by a oscillator of 12MHz circuit, and the modulated 2403-2479MHz wireless signal is transmitting via antenna.
