Re: Justification for Professional Installation for FCC ID#: ZHX-370-00012-01

The MicroPower MPT2500 Camera uses standard N style connectors on its antennas. These provide a rugged, weatherproof solution that ensures a quality long-term connection in outdoor environments. To protect against unauthorized antenna connections, the Cameras will always be installed by trained professionals.

The target markets for the MPT2500 camera are commercial and industrial surveillance applications. These markets are serviced by systems integrators that provide installation and setup services to the end customers. The price point of the camera system is significantly greater than comparable consumer grade products, and therefore beyond the price range of a retail consumer.

The MPT2500 is marketed exclusively to these systems integrators and distributors, and is not sold directly to end-user customers through retail outlets, or mail order. The systems integrators employ trained installation professionals. Only these trained installers are given access to test modes that report signal strength and error rate statistics. These statistics are used to select appropriate installation locations, as well as to properly align the antennas.

Dated this 9th of January 2012

Sincerely,

A handwritten signature in blue ink, appearing to read "Mark Sapper", is written over a light blue horizontal line.

Mark Sapper
