Radiated Emissions (Fundamental)

Test Requirement: FCC Part 15 Section 15.227
Test Method: ANSI C63.4
Test Date(s): 2011-11-24
Temperature: 23.0 °C
Humidity: 65.0 %
Atmospheric Pressure: 101.4 kPa
Mode of Operation: Transmission mode
Tested Voltage 9Vd.c. ("6F22" size battery x 1)

Test Procedure:

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.4 – 2009.

The equipment under test (EUT) was placed on a non-conductive turntable with dimensions of 1.5m x 1m and 0.8m high above the ground. 3m from the EUT, a broadband antenna mounting on the mast received the signal strength. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, For battery operated equipment, the equipment tests shall be perform using new battery. The turntable was rotated to maximize the emission level. The antenna was then moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated.

For below 30MHz, a loop antenna with its vertical plane is place 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1m above the ground.

26dB Bandwidth of Fundamental Emission

Test Requirement: FCC 47 CFR 15.227
Test Method: ANSI C63.4:2009
Test Date(s): 2011-11-24
Mode of Operation: Transmission mode

Test Method:

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

Duty Cycle Correction During 100msec:

Each function key sends a different series of characters, but each packet period (55.0 msec) never exceeds a series of 4 long (1.8msec) and 40 short (0.6msec) pulses. Assuming any combination of short and long pulses maybe obtained due to encoding the worst case transmit duty cycle would be considered (4 x 1.8msec) + (40 x 0.6msec) per 55.0msec = 56.7% duty cycle. Figure A through C shows the characteristics of the pulse train for one of these functions.

Remarks:

Duty Cycle Correction = $20\log(0.567) = -4.9\text{dB}$

The following figures [Figure A to Figure C] show the characteristics of the pulse train for one of these functions.
